From Probability to Information Theory

- Makes use of the probabilistic relationship between attributes to identify how much information one attribute provides on the other
 - Useful to understand the relationship between attributes
 - Can also be used to quantify the loss of information when attributes are lost
- Information = surprise
 - How much surprise is created by an event
 - Information = expectation – realization

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Logarithm

- $\log_b(X)$ is read as “log of X with base b ”
 - Microsoft Excel : “=log(X, b)”
 - What does it mean
 - If $Y = \log_b(X)$, then $X = b^Y$
 - Base 10: $\log_{10}(X)$
 - Microsoft Excel : “=log(X)”
 - If $Y = \log_{10}(X)$, then $X = 10^Y$
 - If $\log_{10}(1000) = 3$, and $1000 = 10^3$
 - Natural logarithm = $\ln(X) = \log_e(X)$, where $e=2.7183$
 - Microsoft Excel : “=ln(X)”
 - Logarithm with base 2
 - Microsoft Excel : “=log($X, 2$)”
 - **$\log_2(X) = \log_{10}(X) / \log_{10}(2) = 3.3219 \log_{10}(X)$**

Information Theory

- Entropy of a distribution
 - Let X be a random variable with the probability distribution $\Pr[X=x_i] = p_i, i=1,2,\dots,n$, where
- Entropy of X (let $H(X) = H(p_1, p_2, \dots, p_n)$)
 - Let Y be another random variable (distributed)
 - Knowledge of Y reduces the uncertainty and hence entropy of X .
 - Therefore, Y provides the following information about X :
- $I(X;Y) = H(X) - H(X|Y)$.
 - Thus $I(X;Y)$ is called Mutual Information

Properties of Information Measure

- $I(X;Y) = H(X) - H(X|Y) = H(Y) - H(Y|X) = I(Y;X)$

Assignment Project Exam Help

- If X and Y are independent
– $H(Y|X) = H(Y)$
– $I(X;Y) = 0$

Example

- Consider 10 balls in a basket
 - 4 large and red, 1 small and red, 2 large and blue, and 3 small and blue
 - You are to pick one ball without looking
- Strategy
 - Check the size of the ball and predict
 - Red if it is large (67% accurate — 4 out of 6)
 - Blue if it is small (75% accurate — 3 out of 4)
- Without the size information, you can only be 50% accurate
- Clearly, size provides information about the color
 - We know that since size and color are not independent
 - Color provides information about the size, as well

$I(\text{Color}; \text{Size})$

- $I(\text{Color}; \text{Size}) = H(\text{Color}) - H(\text{Color} | \text{Size})$
- Without size information:
 $H(\text{Color}) = H() = 1$
- With size information:
 $H(\text{Color} | \text{Size} = \text{large}) = 0.918$
 $H(\text{Color} | \text{Size} = \text{small}) = 0.811$
 $H(\text{Color} | \text{Size}) = H(\text{Color} | \text{Size} = \text{large}) P(\text{Size} = \text{large})$
 $+ H(\text{Color} | \text{Size} = \text{small}) P(\text{Size} = \text{small})$
 $= 0.918 \times 0.6 + 0.811 \times 0.4 = 0.875$
- Information gain $= 1 - 0.875 = 0.125$ bit
 - Size, on average, provides 0.125 bit of information on color

Assignment Project Exam Help

Contingency Table

(Expressing relationship between two attributes)

Compute $H(\text{Liability})$
 & $H(\text{Liability} \mid \text{CR})$
 & $I(\text{Liability}; \text{CR})$

		Liability		
		normal	high	Total
CreditRating	excellent	3	1	4
	good	4	2	6
	poor	0	4	4
	Total	7	7	14

Assignment Project Exam Help

$$H(\text{Liability}) = H\left(\frac{4}{14}, \frac{6}{14}, \frac{4}{14}\right) = -\left(\frac{4}{14} \log_2 \frac{4}{14} + \frac{6}{14} \log_2 \frac{6}{14} + \frac{4}{14} \log_2 \frac{4}{14}\right) = 1.5774$$

$$H(\text{Liability} \mid \text{CR} = \text{excellent}) = H\left(\frac{3}{4}, \frac{1}{4}\right) = -\left(\frac{3}{4} \log_2 \frac{3}{4} + \frac{1}{4} \log_2 \frac{1}{4}\right) = 0.9183$$

$$H(\text{Liability} \mid \text{CR} = \text{good}) = H\left(\frac{4}{6}, \frac{2}{6}\right) = -\left(\frac{4}{6} \log_2 \frac{4}{6} + \frac{2}{6} \log_2 \frac{2}{6}\right) = 0.9183$$

$$H(\text{Liability} \mid \text{CR} = \text{poor}) = H\left(\frac{0}{4}, \frac{4}{4}\right) = 0$$

$$H(\text{Liability} \mid \text{CR}) = 0.811 \times \left(\frac{4}{14}\right) + 0.918 \times \left(\frac{6}{14}\right) + 0 \times \left(\frac{4}{14}\right) = 0.625$$

$$I(\text{Liability}; \text{CR}) = 1 - 0.625 = 0.375$$

$$\Rightarrow I(\text{CR}; \text{Liability}) = 0.375.$$

Entropy and Gain Ratio

- Even though the mutual information between two random variables is always symmetric, observing or recording one variable may be more difficult than the other
 - The more uncertain the variable, higher is the level of this difficulty
 - Entropy measures this difficulty

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Gain Ratio

- Gain ratio (G) measures the information gain relative to the level of difficulty of finding the attribute
- $G(X; Y) = I$
- $G(Y; X) = I(Y; X) / H(X)$
- $G(X; Y) \neq G(Y; X)$

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

$G(\text{CR}; \text{Liability}) \text{ \& } G(\text{Liability}; \text{CR})$

Assignment Project Exam Help

<https://eduassistpro.github.io/>

$I(\text{CR}; \text{Liab})$

$H(\text{Liability}) = H(1/2, 1/2) = 1/2 \log 2 = 1$

$H(\text{CR}) = H(4/14, 6/14, 4/14)$

$G(\text{CR}; \text{Liability}) = I(\text{Liability}; \text{CR}) / H(\text{Liability}) = 0.375$

$G(\text{Liability}; \text{CR}) = I(\text{Liability}; \text{CR}) / H(\text{CR}) = 0.241$

$G(\text{CR}; \text{Liability}) \neq G(\text{Liability}; \text{CR})$

Steps in Data Mining

1. Develop an understanding of the purpose of the data mining project
2. Obtain the data set to be used in the analysis
 - random sampling from a large database to capture records
 - While data mining deals with very large databases
 - usually the analysis to be done requires only thousands or tens of thousands of records
3. Explore, clean, and transform the data
 - This involves verify the data for accuracy and consistency.
 - How should missing data be handled?
 - Are the values in a reasonable range, given the context?
 - Are there obvious “outliers?”
 - The data are reviewed graphically - for example, scatterplots showing the relationship of each variable with each other variable
4. Reduce the data, if necessary
 - eliminate unneeded variables
 - transforming variables
 - creating new variables

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Steps in Data Mining

5. Determine the data mining task
 - classification, prediction, clustering, etc.
6. Choose the data mining techniques to be used
 - regression, neural nets, hierarchical clustering, etc.
7. Use algorithms to perform the task
 - This is typically an iterative process
 - Choosing different variables or settings within the algorithm
8. Interpret the results
 - Recall that each purpose
 - validation data becomes a part of the process
 - likely to underestimate the error that is finally chosen
9. Deploy the model in real world
 - For example, the model might be applied to a purchased list of possible customers
 - action might be “include in the mailing if the predicted amount of purchase is > \$10”

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Data Types

- Variable Measures
 - Categorical variables (e.g., CA, AZ, UT...)
 - Ordered variables (e.g., course grades)
 - Numeric variables (e.g., money)
- Dates & Times
- Fixed-Length Codes
- IDs and Keys – data in other tables
- Names (e.g., Company Names)
- Addresses
- Free Text (e.g., annotations, comments, memos, email)
- Unstructured Data (e.g., audio, images)

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Nominal quantities

- Values are distinct symbols
 - Values themselves serve only as labels for names
- Example: `att` weather data
 - Values: “s ny”
- No relation is implied among values (no ordering or distance measure)
- Only equality tests can be performed

Ordinal quantities

- Impose order on values
- But: no distance between values defined
- Example: [Assignment Project Exam Help](https://eduassistpro.github.io/)
attribute “te data”
 - Values: “ho <https://eduassistpro.github.io/>
- Note: addition and subtraction make sense
- Distinction between nominal and ordinal not always clear (e.g. attribute “outlook”)

The ARFF format

```
%  
% ARFF file for weather data with some numeric features  
%  
@relation weather  
  
@attribute outl ny}  
@attribute temp  
@attribute humi  
@attribute windy {true, false}  
@attribute play {yes, no}  
  
@data  
sunny, 85, 85, false, no  
sunny, 80, 90, true, no  
overcast, 83, 86, false, yes  
...
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Additional attribute types

- ARFF supports *string* attributes:

```
@attribute description string
```

- ◆ Similar to **Assignment Project Exam Help** list of values is not pre-specified **<https://eduassistpro.github.io/>**

- It also supports **Add WeChat edu_assist_pro**

```
@attribute today date
```

- ◆ Uses the ISO-8601 combined date and time format *yyyy-MM-dd-THH:mm:ss*

Sparse data

- In some applications most attribute values in a dataset are zero
 - ♦ E.g.: word counts in a text categorization problem

- ARFF supports sparse data

Assignment Project Exam Help

```
0, 26, 0, 0, 0  
0, 0, 0, 42, 0, 0, 0, 0, 0,
```

Add WeChat edu_assist_pro

```
{1 26, 6 63, 10 "class A"}  
{3 42, 10 "class B"}
```

- More details about ARFF:
 - ♦ <http://www.cs.waikato.ac.nz/~ml/weka/arff.html>

Sampling Data

- Sampling can be used to create better data sets (training or testing) to build better models.
- Random sampling techniques:
 - **Simple random sampling**: Select a random sample.
Divide data set into two groups: Business and 'Private' travelers. Assuming the proportion of Business travelers is 10%, we needed at least 100 Private travelers for our model. Randomly select 900 Business travelers.
 - **Proportionate stratified sampling**: Select a weighted sample. Also called 'oversampling': used if a particular group of examples is important but not well represented in the data set.
e.g. In direct mail response prediction you might select 10 responders in the dataset for every non-responder you select. For claims analysis, you might weigh the fraudulent claims (which are often naturally rare).

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Missing Value Treatment

- **Reason for missing?**

- Not recorded
- Not applicable
- Customer refused to provide

Assignment Project Exam Help

- **Dealing with m**

<https://eduassistpro.github.io/>

- Delete the records with missing val
- Add flag fields ('address_missing', te missing values, or
- Estimate missing value:
 - Use average over entire data set
 - Use average over similar records
 - Use an advanced prediction technique

Add WeChat: edu_assist_pro

Noise in Data

- The biggest challenge with noisy data sets is that it is difficult to identify noise
- In some specific cases, the noise can be identified
 - Value out of range (e.g., Age = 150)
 - Meaningless value (e.g., Li-1234 without a license)
 - Mismatched value (e.g., City, State, and PIN not matching against the postal database)

Attribute Selection

- Smaller attribute sets are simpler to understand, but may produce an overly simplistic model
- Larger attribute sets may lead to overfitting
- Eliminate useless attributes
 - Related to redundancy
- Attribute consolidation
 - Combine a set of binary attributes into one
- Attribute expansion
 - Expand a nominal attribute into a set of binary ones
- Attribute conversion
 - Change the data type of an attribute

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Formal Dimension Reduction

- If you have multiple highly correlated columns, then reduce number of columns
 - e.g. height
- Principal components
 - Subsets of numeric (not categorical) variables
 - measured on the same scale
 - highly correlated
 - Come up with few variables (one or two or three)
 - that are weighted linear combinations of original variables
 - retain the explanatory power of the original data

Principal Components

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

The line z_1 is the direction in which the variability of the points is largest.

1st principal component

Example: 10-dimensional data

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Attribute Consolidation

- Example 1: Suppose you have two 0/1 attributes: “Male” and “Female”
 - A row of data contains the values for the attributes
- At the same time, you have a new nominal attribute “Gender” with two possible values — *male* and *female*

Attribute Expansion

- Attribute expansion is the opposite of attribute consolidation
 - A nominal set of 0/1 attribute
- Set-values a
 - Example: Hobby, Genre, I
- It can be replaced by a set of binary attributes

Attribute Conversion

- Ratios
 - e.g. Try income divided by number of employees, to get a measure of productivity per employee
- Derived Values
 - e.g. derive cust *thdate* (or production-*date*), as age m
- Changing the data type of attrib
 - Nominal to numeric or vice versa

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Binning

- Binning (discretization) converts numeric values to discrete categories. e.g. low-income is ≤ 30 , high-income is > 30
- For example:

- Equal-Interval binning

- Bin intervals of equal width, irrespective of the number of items per bin

- Equal-Frequency binning

- Equal number of items per bin, irrespective of bin width

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Bins

	31-40	41-50
26	35 37	42 45 48

21-26	29-37	38-48
25 26 26	29 35 37	42 45 48

The entropy of a random variable is higher when

A: It has many different states, each of which has low likelihood

B: It has very few states, each has high likelihood

C: It has many different states, only a few states have very high likelihood

D: It has very few states

E: None of the above

When to Normalize Data?

- Rescale attributes to the range of 0 to 1
 - Subtract the min, and divide by (max – min)
- Results in all variables getting equal importance
- Not advisable
 - When the units differ for the variables (e.g. dollars), and importance
 - e.g. sales of jet fuel, sales of heating oil
- Advisable
 - if the variables are measured in quite differing units
 - unclear how to compare the variability of different variables
 - e.g. dollars for some, parts per million for others
 - or if variables measured in the same units, but scale does not reflect importance
 - e.g. earnings per share, gross revenues

Data Preprocessing using Weka
